

Langflow POC

1. Agent to compare test page (HTML) with Figma design

I am currently working on a project where UI validation is a primary requirement. For this, we need to compare the actual UI with the Figma design specifications. I have already implemented Percy for visual testing, but it only compares UI changes between previous and latest builds.

However, I need an agent/tool that can validate UI elements directly against the Figma design, such as font color, font size, line height, font weight, spacing, padding, and other design properties.

2. Agent to extract website details from Crownpeak dashboard

We have more than 35 websites for which we need to extract key metrics such as usability score, SEO score, and other relevant details from the Crownpeak dashboard.
